I want to create a “tea maker” python program that determines the perfect tea for someone depending on their preferences.
Some of these preferences include mood, sweetness, toppings, and temperature. With that, the program will extract elements from a list (depending on each preference) and combine to ultimately make the perfect tea.

1. Ask the user their name
2. Introduce the program to them
3. Ask the user about how they are currently feeling given a selection of emotions
4. Ask a series of would-you-rather questions in an odd number
5. Ask the user if they like their tea hot or cold
6. Ask the user if they like their tea on the sweeter or bitter side → if it is neither or either, give them the option of tart/sour
7. Use their would-you-rather answers to determined toppings
